

CIVITAS indicators

Share of deliveries from a microhub (TRA_FR_IL4)

DOMAIN

 Transport	 Environment	 Energy	 Society	 Economy
--	---	--	--	---

TOPIC

Freight

IMPACT

Innovative last mile solutions

Increased use of microhubs to break bulk deliveries close to the delivery area and complete the last mile with low- and zero-emission modes.

CONTEXT AND RELEVANCE

Microhubs are small consolidation and trans-shipment points located close to the delivery area, where freight arriving on larger vehicles is broken into smaller loads and transferred onto cargo bikes, on-foot couriers, or light electric vehicles for last-mile completion. By shifting the final leg of the delivery away from larger motorised vehicles, microhubs can reduce vehicle-kilometres, emissions, noise, and pressure on kerbside space in the immediate delivery area, while also improving access in streets or zones with restricted vehicle access.

This indicator measures the share of deliveries in the pilot area that are completed from a microhub. **It is a relevant indicator when the policy action aims to increase the use of microhubs to complete last-mile deliveries with lower-emission modes. A successful action is reflected in a HIGHER value of the indicator after the experiment compared to the BAU case.**

DESCRIPTION

The indicator assesses the extent to which deliveries in the pilot area are being completed through microhubs rather than delivery from larger vehicles.

The indicator is expressed as a **percentage (%)**.

METHOD OF CALCULATION AND INPUTS

The indicator should be calculated **exogenously** based on the required inputs and then coded in the supporting tool.

Method 1

Survey delivery companies

Significance: **0.75**

INPUTS

The following information is needed to compute the indicator:

- The **total number of deliveries** completed from microhubs in the pilot area during a defined observation period.
- The **total number of deliveries** made in the pilot area during the defined observation period, including those completed from the microhub.

EQUATIONS

The equation that should be applied to quantify the indicator is:

$$ShaMH = \frac{DelMH}{TotDel} * 100$$

Where:

ShaMH = Share of deliveries from microhubs (%)

DelMH = Total number of deliveries completed from microhubs during the observation period

TotDel = Total number of deliveries made in the pilot area during the observation period

ALTERNATIVE INDICATORS

This indicator measures the share of deliveries completed from microhubs. To assess the adoption of other innovative last-mile delivery solutions, the framework provides indicator **TRA_FR_IL1** for the share of deliveries made by cargo bike, **TRA_FR_IL2** for the share of deliveries made by autonomous bots, and **TRA_FR_IL3** for the share of deliveries made by drones.
